The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access CC memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using CC that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are CC likely to encode antigens have been identified and these polypeptides can CC be used in a vaccine composition against S.aureus infection. The CC saureus in a sample. S.aureus is implicated in numerous human diseases, CC including cellulitis, eyelid infections, food poisoning, osteomyelitis, concluding cellulitis, eyelid infections, scalded skin syndrome, toxic shock CC syndrome, etc. Organisms transformed with the DNA sequences can be used CC for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating CC computer readable medium.

cell line into which an apoptosis resistance gene has been introduced.
The recombinant viruses generated are capable of expressing apoptosis-
associated genes. These can then be used in a variety of diseases for
which the induction of apoptosis by gene transfer, or where the
inhibition of harmful apoptosis, is therapeutic. The recombinant viruses
are useful as vectors for gene therapy which can be applied to cancer
therapy for destroying cancer cells selectively, the treatment of
autoimmune diseases and graft rejection reaction, and apoptosis induction
therapy for inflammatory cells in inflammatory diseases. Prior arts have
encountered the problem where if an adenovirus vector capable of
expressing an apoptosis-associated gene is introduced into animal cells,
the cells producing the virus will be destroyed because the period of
time required to induce cell death apoptosis is shorter than that
required to replicate and produce the virus, resulting in failure to
obtain a recombinant virus having the integrated apoptosis-associated
gene. In this invention an apoptosis-resistant 293 cell line (having an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cowpox virus; bsr; viral vector; expression; apoptosis; resistance; crmA; bcl-2; bcl-x1; FLIP; survivin; IAP; ILP; adenovirus; cancer; autoimmune disease; graft rejection reaction; inflammation; inflammatory disease; ss.
Sequence
                                    apoptosis resistant gene introduced) is established and overcomes the problem. The present sequence represents the base sequence of the plasmid pRx-ires-bsr, which contains the cowpox virus bsr gene, and is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New apoptosis-resistant virus-sensitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI;

cell line into which an apoptosis resistance gene has been introduced. The recombinant viruses generated are capable of expressing apoptosis-associated genes. These can then be used in a variety of diseases for which the induction of apoptosis by gene transfer, or where the inhibition of harmful apoptosis, is therapeutic. The recombinant viruses are useful as vectors for gene therapy which can be applied to cancer therapy for destroying cancer cells selectively, the treatment of autoimmune diseases and graft rejection reaction, and apoptosis induction therapy for inflammatory cells in inflammatory diseases. In this invention an apoptosis-resistant 293 cell line (having an apoptosis resistant gene introduced) is established and overcomes the

CC The recombinant viruses generate are capture of capture of the capture of capture of capture of associated genes. These can then be used in a variety of diseases for cc which the induction of apoptosis by gene transfer, or where the cc inhibition of harmful apoptosis, is therapeutic. The recombinant viruses care useful as vectors for gene therapy which can be applied to cancer cc therapy for destroying cancer cells selectively, the treatment of cautoimmune diseases and graft rejection reaction, and apoptosis induction ct therapy for inflammatory cells in inflammatory diseases. Prior arts have encountered the problem where if an ademovirus vector capable of cc expressing an apoptosis associated gene is introduced into animal cells, the cells producing the virus will be destroyed because the period of time required to induce cell death by apoptosis is shorter than that combinant virus having the virus, resulting in failure to obtain a recombinant virus having the integrated apoptosis-associated gene. In this invention an apoptosis-resistant 293 cell line (having an apoptosis resistant gene introduced) is established and overcomes the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δÃ
                                                                                                                                                                                                                                                                                        The present invention describes an apoptosis-resistant virus-sensitive cell line into which an apoptosis resistance gene has been introduced. The recombinant viruses generated are capable of expressing apoptosis-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cowpox virus; bsr; viral vector; expression; apoptosis; resistance; crmA; bcl-2; bcl-xl; FLIP; survivin; IAP; ILP; adenovirus; cancer; autoimmune disease; graft rejection reaction; inflammation;

                                                                                                                             content of codons for glutamate. Three major repetitive sequences are: one motif from bp 34 to bp 156 is repeated from bp 289 to bp 411; another motif from bp 477 to bp 521 is repeated tandemly twice from bp 1232 to bp 566 and from bp 567 to bp 611; a third motif from bp 1174 to bp 1233 is repeated tandemly 11 times. This last repetitious region consists of 360bp repeats differing only in 3 bases GAT coding for aspartate. This region is flanked to the 5' terminal od a degenerated 60 bp repeat. GC content of the coding part of the insert is on average 30%, and of the non-coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dziegiel
Jakobsen
                                                                                                                                                                                                                                                                   insert to a "TĀA" stop codon. It is longest ORF found in the sequence. Sequence displays some of the characteristics of other malaria nucleic acid sequences: tandemly repeated motifs, high AT content and a corresponding preference for codons containing these bases, and a high
                                                                                                                                                                                                                                                                                                                                                                                                      Polypeptide(s) derived from Plasmidium falciparum antigen -vaccines and in production of antibodies, for diagnosis and therapy of malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               03-MAR-1989;

                                                                                                                                                                              This sequence corresponds to the coding sequence for a Plasmodium falciparum strain KI pre-erythrocytic liver stage antigen-3 (LSA-3) protein. The gene sequence was isolated by screening a P. falciparum strain T9/96 library with serum from a missionary treated by prophylaxis (for strain T6/96 see FR9101286). Of 20 clones isolated, clone 7295 was used to screen a library generated from Thai strain KI. One clone contained a 6.85 kb insert including the genomic sequence T78867. The gene comprises a 1.8 kb region encoding 3 major blocks of 4 amino acid repeats and a 3' hydrophobic region corresponding to a 91ycosyl-phosphatidylinositol membrane anchoring sequence. The invention relates to new polypeptides of at least 10 amino acids derived from the LSA-3 polypeptide with the exception of the peptides W24791-4. The LSA-3 peptides can be used to raise antibodies and as vaccines for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Plasmodium falciparum; pre-erythrocyte; liver stage antigen; serum; prophylaxis; Thai strain; gene organisation; exon; intron; hydrophob; glycosyl-phosphatidylinositol membrane anchoring sequence; antibody; vaccine; immunotherapy; malaria; ds.
Plasmodium falciparum poly:peptide(s) and related nucleic acids derived from the liver stage antigen-3, useful for malaria vacci prodn. and diagnosis

One clone contained a 6.85 kb insert including the sequence presented here. The gene organisation comprises a first exon, a short 168 bp intron and a 5 kb second exon containing a 1.8 kb region encoding 7 blocks of 4 amino acid repeats and a 3' hydrophobic region corresponding to a glycosyl-phosphatidylinositol membrane anchoring sequence. The invention relates to new polypeptides of at least 10 amino acids derived from the LSA-3 polypeptide with the exception of peptides W24791-4. The LSA-3 peptides can be used to raise antibodies

The polypeptides can inhibit, block or reverse the sequestration of erythrocytes in patients suffering from malaria. Nucleic acids derived from the PfEMP1 gene can be used as probes and primers to identify a Plasmodium falciparum parasite, the primers used to generate characteristic amplification patterns from different P. falciparum strains. Antibodies specifically lumnunoreactive with the PfEMP1 polypeptide or its fragments may be used in diagnosis of malaria infection. This sequence encodes the pfEMP1 protein of the MC type of Plasmodium falciparum. An alternative, truncated version of the coding sequence (a cDNA clone)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        develop

Products derived from Bb can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of biosynthetic products, e.g. enzymes. Borrella belongs to a family of motile, spiral shaped bacteria called Spirochetes. Spirachetes are pathogenic in humans and Borrelia causes epidemic and endemic relapsing fever, and Lyme borreliosis, more commonly known as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated Borrelia burgdorferi nucleic acids - used to products for the detection, diagnosis, characterisation, and therapy of infections, particularly Lyme disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              345710
                                                                                                                                                           This sequence encodes the Plasmodium falciparum gp190/MSP-1 (merozoite surface protein). This gene is used in a method for stabilising the gene sequences by reducing the AT content. Such products are useful in vaccines against malaria or for producing monoclonal antibodies (for passive immunisation). The complete gp190 protein can now be produced outside the parasite and has, at least over extended regions, the native pattern of folding. Larger amounts of the protein can be produced recombinantly than would be possible using the parasites as source.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               gp190;

be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scaided skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polyment and surgical would infect the polyment and surgical would be sequenced with the DNA sequences can be used for recombinant production of the polyment and surgical would be sequenced with the DNA sequences.
                                                                                                                                              for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S.aureus DNA sequences contained on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides of the process of the control of the
